

Introduction

Unlike the Standalone monitor, the Embedded, Javaagent-based monitor, is started embedded in the process of the application it monitors. To use the Embedded monitor one typically has to do the following:

- Enable JMX for the application which will be monitored, if metrics are retrieved via JMX (e.g. Solr, HBase, Kafka, Cassandra, but not Elasticsearch)
- Add Embedded monitor to the application's Java command-line
- Restart the application

For information specific to your particular application please go to <http://apps.sematext.com/spm-reports/client.do> where you can select you application and see the exact and simple instructions to follow.
