

To send new events to your Logsene application, you have two ways to connect:

- HTTP / HTTPS, by using the Elasticsearch API on **logsene-receiver.semamtext.com**
- UDP / TCP / RELP / TLS, by using the syslog receiver on **logsene-receiver-syslog.semamtext.com**
- UDP / TCP by using the socket receiver for JSON on **logsene-receiver-syslog.semamtext.com**

Both options work with existing applications, such as Logstash, Fluentd, rsyslog or syslog-ng. And you can always write your own application or script that works with Elasticsearch or syslog or Apache Flume or really any other tool that can send data to Logsene's Elasticsearch API.

To see more details on a specific option, click on one of the child pages below.
