

Run Logagent as Heroku Log Drain

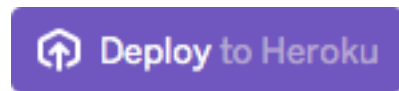

You can forward your Heroku logs to Logsene using Heroku Log Drain like this:

```
heroku drain:add --app HerokuAppName URL
```

Here are the steps:

To ship your Heroku logs to Logsene or Elasticsearch deploy Logagent on Heroku. It will act as an HTTPS log drain.

1. Get a free account apps.semamtext.com
2. Create a Logsene App to obtain the Logsene Token
3. Deploy logagent-js to Heroku using the Deploy to Heroku button

... or use the following commands:

```
git clone https://github.com/semamtext/logagent-js.git
cd logagent-js
heroku login
heroku create
git push heroku master
```

4. Add the log drain using the URL format like `https://loggerAppName.herokuapp.com/LOGSENE_TOKEN`
Use the following command to grab the dynamically assigned name from “heroku create” command.

```
export LOGSENE_TOKEN=YOUR_LOGSENE_TOKEN
heroku drains:add --app YOUR_HEROKU_MAIN_APPLICATION `heroku info -s | grep web-url | cut
```

Now you can see your logs in Logsene, define Alert Queries or use Kibana for Dashboards.

5. Scale Logagent service on Heroku

To handle high log volume, scale Logagent on demand using

```
heroku scale web=3
```
